

Understand Your Site's Medical-Grade Cleaning

Supported and protected by Bee Line, your trusted medical grade cleaning partner.

1 Surface Cleaning Prep

Before applying disinfectant, we must first clean surfaces fully to remove debris

Strategic Cleaning Process:

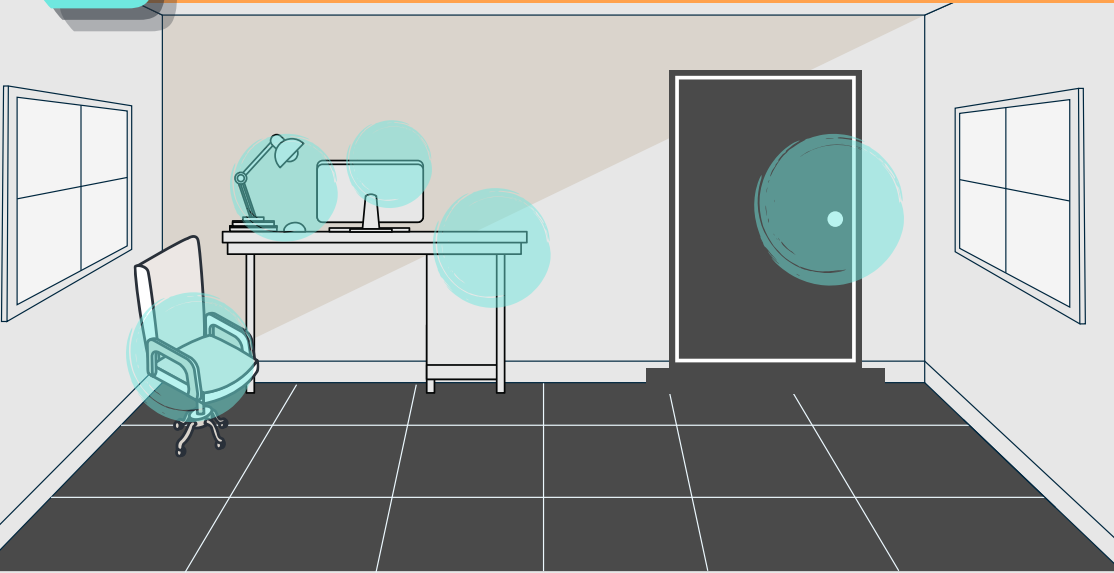

We use sequential cleaning across every room & surface, moving from top-to-bottom of walls, and using unidirectional wiping across surfaces to remove dirt, dust & particles efficiently.

High Quality Products:

We utilize HEPA filter vacuums for improved indoor air quality, as well as color coded cloths to avoid cross contamination

2 Disinfecting High Touch Points

Disinfect HTPs:

We identify & disinfect all high touch & high traffic points:

- Door handles
- Desks
- Chair Arms
- Much more!

Disinfectant Efficacy:

We utilize broad-spectrum disinfectants to kill a variety of bacteria, viruses, and pathogens, along with EPA registered products to protect against SARS-CoV-2. We also partner with ImageFIRST to launder our microfiber towels to the highest standard at all of our sites.

3 Medical Grade Training

Infection Prevention Training:

All frontline employees are trained in infection prevention which covers transmission based precautions, PPE, pathogen disinfection, cleaning and disinfecting products, and much more.

Other Trainings include: OSHA-required trainings (blood borne pathogens and hazard communication) | Workplace safety trainings | Emergency preparedness trainings

4 Quality Control and Auditing

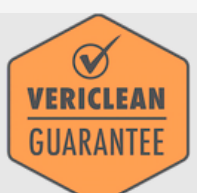

Quality Control Audits:

Managers conduct Quality Control Audits to ensure trainings, applications, and techniques are held to highest standard consistently over time.

Medical Grade Blacklight Audits:

Medical-grade black light auditing tracks & audits how thoroughly high touch points are being cleaned at your facility.

Protect your site with confidence.
